

# CLIMATE FORWARD

## Improved Cook Stove Forecast Methodology Summary of Changes from Version 1.0 to Version 2.0 September 2022

The Improved Cook Stove Forecast Methodology version 2.0 incorporates the following significant changes from version 1.0 as well minor editorial changes.

### Section 4 The GHG Assessment Boundary

- Adjusted Table 4.1 (Sources, Sinks and Reservoirs) to indicate inclusion of CH<sub>4</sub> and N<sub>2</sub>O in both the baseline and project scenario project boundaries as major emission sources. **(Section 4)**

### Section 5 Quantifying GHG Emission Reductions

- Altered Equation 5.1. Calculating Emission Reductions by Project Batch to include emission factors for CO<sub>2</sub> emissions from non-renewable woody biomass that is substituted or reduced (CO<sub>2</sub>- EF<sub>NRB</sub>) and non-CO<sub>2</sub> (methane and nitrous oxide) emissions from renewable woody biomass that is substituted or reduced (Non-CO<sub>2</sub>- EF<sub>NRB</sub>). These two emission factors have replaced the use of EF<sub>NRB</sub> in the original equation. **(Section 5)**

### Section 6 Project Implementation and Monitoring

- Adjusted Table 6.1 Project Monitoring Parameters to include parameters that must be monitored for Equation 5.2 to reflect the changes described above. Now requires that CO<sub>2</sub>- EF<sub>NRB</sub> and Non-CO<sub>2</sub>- EF<sub>NRB</sub> be fixed and recorded at the time of the project start date to satisfy project monitoring requirements **(Section 6.1)**
